Dear Hiring Team at Tessera Labs,

Re: AI Engineer

I'm applying for Tessera Labs' agent systems role. My sharpest proof: at Fortinet's AIOps R&D group, after four years shipping production software, I took an agentic diagnostics system from hackathon prototype to production deployment, cutting mean resolution time by roughly 70%.

Its LLM planned multi-step tool calls over network telemetry, invoked APIs through structured function calling, and verified hypotheses autonomously for root-cause analysis. I also scaled OpenSearch ingestion from 50 to 2,000 events per second in Golang while maintaining reliability and observability, so I've run both the agent layer and the infrastructure beneath it. A filed patent applies unsupervised distributional thresholding to connectivity anomalies, classical ML where it beats a bigger model.

At Georgia Tech's CORE Robotics Lab I build a closed-loop pipeline for parametric CAD code generation: an LLM writes CadQuery programs, an execution harness returns compile and geometry errors, and a LangGraph repair loop fixes them, evaluated by a 202-test harness scoring geometric correctness, repair quality, and VLM-based visual judgment. SHASTRA retrieves and adapts prior tool-call sequences for long-horizon tasks; ARTEMIS routes requests across vision-language backends with a trained neural router.

Tessera's thesis, a governed multi-agent engine treating process, data, and code as one connected system and shipped as a product, not a service, is exactly the verified, traceable agent work I'm eager to continue. Thank you for your consideration. I'd welcome a conversation about making agent failures legible, reproducible, and impossible.

Sincerely,

Vedaang Chopra
